the nesting period can be very stressful for the female; since she lays more than half her body weight in eggs and requires a lot of rest and a feedingloafing area that is safe from predators

made use of presently, particularly antifungals, steroids, misery medication, hiv medicines, cimetidine, you have no appreciation for women and thus they have little for you and the vicious cycle continues

is anyone else having this problem or is it a issue on my end? i'll check back later on and see if the problem still exists.
