methotrexate side effects in children

Method: Iron was found to be in the form of Fe²⁺ and Fe³⁺ in the sample. The sample was dissolved in 10 mL of 10% HCl and the solution was diluted to 100 mL with distilled water. The solution was then analyzed by atomic absorption spectrophotometry (AAS) using a graphite furnace. The results showed that the sample contained 0.000 g of Fe²⁺ and 0.000 g of Fe³⁺. The total iron content was 0.000 g. The results are consistent with the expected composition of the sample.
